Introduction

The Agilent U1250A series Handheld Digital Multimeter gives you 4.5 digit resolution with a 50,000 count full scale and basic DC voltage accuracy of up to 0.025%. These features give you the flexibility to perform quick validation measurements or perform tolerance checks and marginal failure troubleshooting. It also offers True RMS, dBm, and AC+DC readings to measure both sinusoidal and non-sinusoidal waveforms accurately.

Versatile functionality

The U1250A series Handheld Digital Multimeter delivers many features that you would expect from a benchtop multimeter. These instruments come with all the basic measurement functions and added functionality needed in today's changing maintenance environment such as temperature measurements, frequency measurements, 4–20 mA process loop measurement with % readout, 20 MHz frequency counter (U1252A only), and dBm measurements.

More than just a measurement tool

The U1250A series expands users' capability beyond typical measurements. These instruments provide data storage capability which can be done both

manually or automatically with the optional PC interface cable. The accompanying Agilent Graphical User Interface (GUI) further extends the potential of these instruments by allowing you to customize your data logging needs. Other features include sophisticated math functions that allow users to manipulate the data obtained. The U1252A can be used as a programmable square wave generator that allows you to stimulate electronic circuits for debugging purposes.

Uncompromising ruggedness and safety

Use The U1250A series Handheld Digital Multimeter with confidence in almost any environment. These instruments come in a robust package with shock absorbing overmold and operate within their rated specifications from -20 °C right up to +55 °C. Furthermore, these instruments are rated at Cat III 1000 V (IEC 61010 Compliant) which allows you to confidently make measurements on building electrical installations, at locations between the main circuit breaker and the mains socket-outlets, including measurements performed on equipment that is permanently connected to the mains circuits.

[1] Input impedance: >1G Ω for 50 mV~1000 mV ranges. For U1251A, input impedance is 10 M Ω (nominal) for 5 V~1000 V ranges. For U1252A, input impedance is 10 M Ω (nominal) in parallel with 1.1 M Ω at dual display.

[2] The accuracy could be 0.05%+10 for U1251A and 0.05%+5 for U1252A. Always use NULL function to zero out the thermal effect before measuring the signal.

[3] The accuracy of 500 Ω and 5 k Ω is specified after NULL function, which is used to subtract the test lead resistance and the thermal effect

[4] For the range of 50 M Ω and 500 M Ω , the R.H. is specified for <60%.

[5] The accuracy is specified for <50 nS and after NULL function with open test lead.

[6] Always use NULL function to zero out thermal effect with open test lead before measuring the signal. If NULL function is not used, an additional 20 counts needs to be added to the DC current accuracy. Thermal effect could occur due to the following:

- Wrong operation to measure the high voltage of 50 V ~ 1000 V for resistance, diode, and mV measurements.

- After battery-charging has completed.

- After measuring a current greater than 440 mA, it is suggested that the meter be left to cool down for twice the measuring time used.

[7] Current can be measured up to 10 A continuously. An additional 0.5% needs to be added to the specified accuracy if the signal measured is in the range of 10 A~20 A for 30 seconds maximum. After measuring a current of > 10 A, leave the meter to cool down for twice the measuring time used before application of low current measurement.

[8] Only available in U1252A.
