1 Introduction

This Manual contains information on Network Analyzer remote control and its data communication by means of user programs written with COM/DCOM technology.

COM technology is used when a user program runs together with an external measurement instrument program on one PC. DCOM technology is used when a user program runs on a PC connected with the measurement instrument by LAN.

Methods and techniques for writing of user programs are same for the both technologies. The only difference between the technologies is that the DCOM technology requires additional LAN setting performed by the LAN administrator.

Before reading this Manual, familiarize yourself with Analyzer Operating Manual.

2 Scope of Manual

This Manual directly applies to the S8081 model Network Analyzer and to the software module S8081.exe.

3 Registering COM Server

To register COM server of the analyzer run the executable module from command prompt with the */regserver* keyword. To unregister COM server of the analyzer run the executable module from command prompt with the */unregserver* keyword. Administrative rights is required to register/unregister COM server. Also user has ability to register COM server during the software installation procedure.

Example of the COM server registration command:

```
S8081.exe /regserver
```

4 COM Technology Overview

COM stands for *Component Object Model*. This programming technology was developed by Microsoft for two purposes:

- the model provides the specification for interaction of binary modules created in different programming languages;
- the model defines the interfacing between a client application and a server application running either on the same PC or on two different PCs. In the latter case, the technology has DCOM abbreviation – Distributed COM.

5 Automation Server

The network analyzer executable module contains a built-in COM server that enables other programs to access its functionality. The COM server was developed in conformity with the *COM automation* specification. COM automation is a technology allowing control over the COM server by the programs written in both traditional compiling programming languages and interpreting programming languages, such as VBScript. This enables the server applications to make their functionality accessible to many more clients.

6 Automation Controllers

Automation controllers are client programs, which use internal functionality of COM servers. Automation controller programs are developed by users for writing their own add-ons for the system.

User programs can be written in different languages:

- programming languages with built-in COM support, such as Visual Basic®, Delphi, Java;
- universal programming languages, such as C, C++;
- Microsoft Excel and Word office applications as they include built-in programming language Visual Basic for Applications®;
- program generators, such as National Instruments LabVIEW®, MathWorks MATLAB®.

Examples used thru this Manual are written in Visual Basic (VB). Appendix 3 contains examples written in VB, C++, and LabView languages.

Examples\COM\VBA folder contains source codes for examples written in Visual Basic for Applications® (Microsoft Excel files).

Examples\COM\CPP folder contains source codes for the C++ language examples.

Examples\COM\LabView folder contains source codes for the LabView language examples.

7 Local and Remote Server

The network analyzer executable module can function either as a *local* server or as a *remote* server of COM automation.

Local server runs on the same PC with the automation controller and each of the programs is executed as an individual application in a separate window. COM technology is used in this case (Figure 1).

Remote server and the automation controller run on different PCs connected by LAN. DCOM (Distributed COM) technology is used in this case (Figure 2). When using DCOM it is necessary to configure the local network by means of DCOM Windows tools.

The same automation controller is used for the both COM and DCOM technology. Some changes to the user program may be required in operators, which establish connection with the server. Moreover, DCOM technology requires additional settings of the LAN performed by the LAN administrator.

Figure 1. COM technology

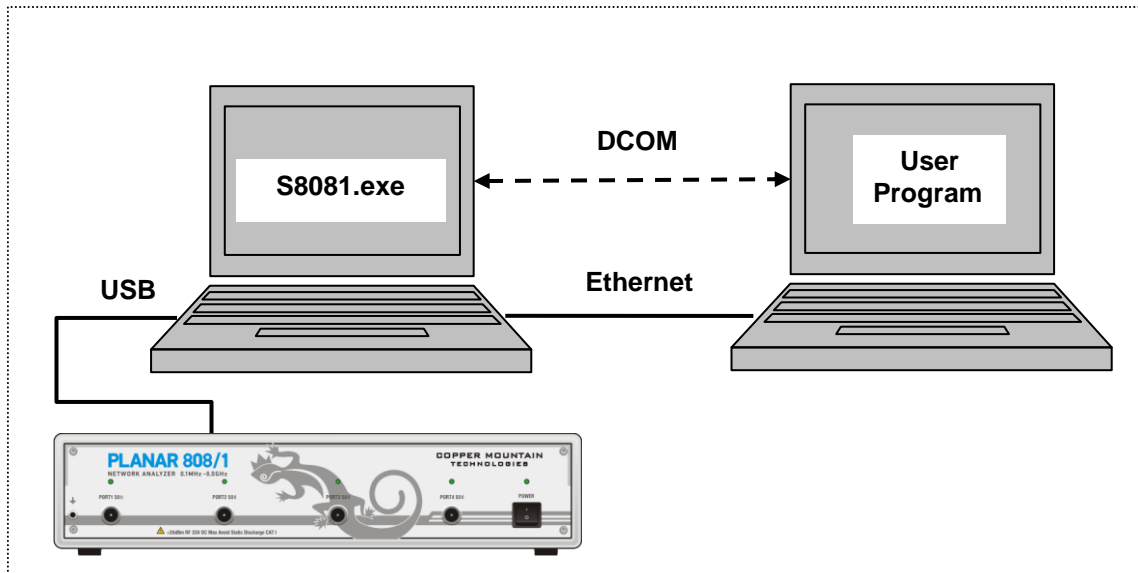

Figure 2. DCOM technology

8 Structure of COM Objects

COM server contains several *objects*, which provide different functionality of the server. The COM objects of the network analyzer executable module are organized in a hierarchical structure. Figure 3 shows the main COM objects, which comprise the first three levels of the hierarchical structure of the COM server. COM objects provide various *methods* and *properties*, which allow access to the server functions; besides, they allow access to the objects of the lower levels, which are not shown in Figure 3.

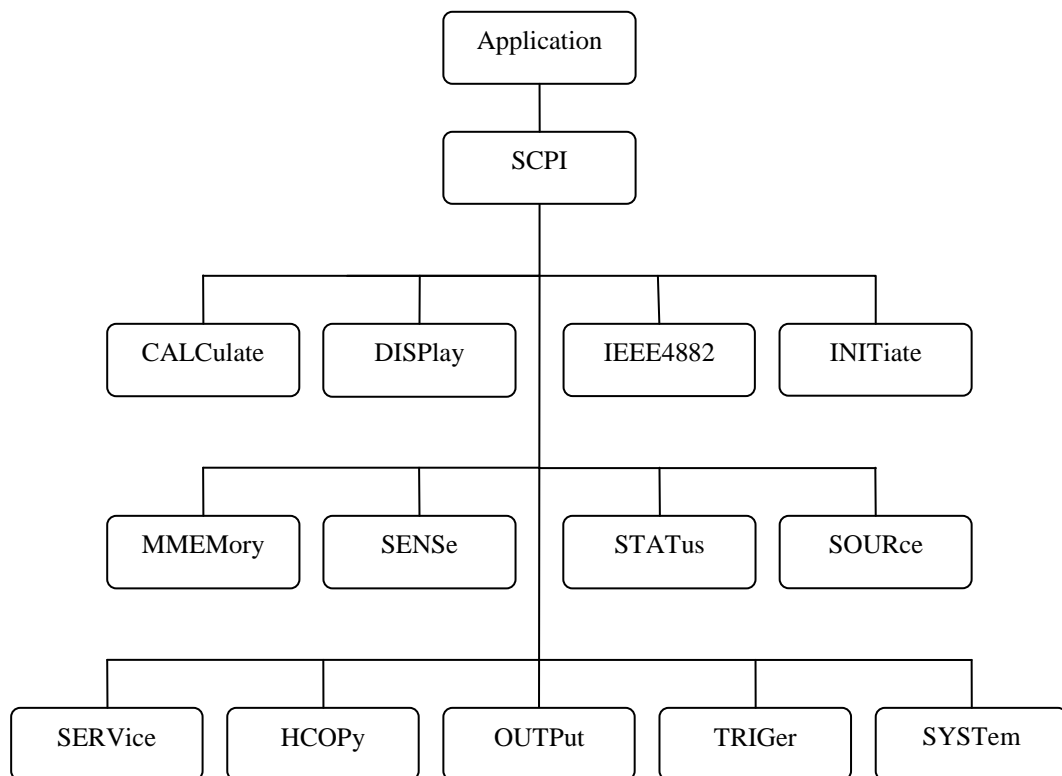

Figure 3. The structure of COM objects

The Object *Application* is in the top of the hierarchy of the COM server. Access to the lower level objects is implemented via higher level objects.

Note The hierarchy of COM objects and their names are taken from the command system used for control over the Network Analyzers via GPIB interface. GPIB communication protocol complies with the IEE488.2 standard. In accordance with this standard the SCPI programming language is used. Operators in SCPI have hierarchical chain structure, for example:

CALCulate:PARAmeter:DEFine S11

The same command in COM written in VB programming language is as follows:

app.SCPI.CALCulate.PARAmeter.DEFine = "S11"

9 Accessing the Application Object

To establish connection with the COM server application, create an object reference in the client program. In COM programming the object reference needs to be acquired preliminarily, to be used later to access the object functionality. To define an object in Visual Basic perform the following:

- 1) Declare a variable as an object.
- 2) Assign the object to this variable.

To declare a variable, use *Dim* operator or other declaration statement (*Public*, *Private* or *Static*). The variables used for references should be of the types *Variant*, *Object*, or a type of a specific object. For example, the following three operators declare app variable:

```
Dim app
Dim app as Object
Dim app as S8081.Application
```

Use *Set* operator and *CreateObject* (*ObjectName*, *HostName*) function to assign a specific object to a variable.

<i>ObjectName</i>	Object name is always equal to "S8081.Application"
<i>HostName</i>	Network name of the PC hosting the COM server. This parameter is not specified in case of a local server.

For example, the following operators create *Application* object and assign it to app variable:

```
Set app = CreateObject("S8081.Application")
Set app = CreateObject("S8081.Application", "Host_Name")
Set app = CreateObject("S8081.Application", "192.168.1.149")
```

Note	The first form of the operator is used to create the reference to the local COM server, the second and third forms are used to create the reference to the remote DCOM server.
------	--

To allow access to the objects of a lower level of the hierarchy, these objects are specified after the reference to the higher level object and separated from it by a dot. For example:

```
Dim SystObj
Set SystObj = app.SCPI.SYSTem
```

COM objects can have indices. For example, *CALCulate*, *INITiate*, *SENSe*, *SOURCE* objects represent various aspects of the 16 measurement channels of the Analyzer. Therefore, it is necessary to write the channel index from 1 to 16 to acquire the data of these objects. For example:

```
Set SensObj1 = app.SCPI.SENSE(1)
Set SensObj2 = app.SCPI.SENSE(2)
```

Visual Basic allows omitting of such indices; in this case the indices are considered as equal to 1. For example, the following VB operators are equivalent:

```
Set SensObj = app.SCPI.SENSE(1)
Set SensObj = app.SCPI.SENSE
```

10 Object Methods

Objects have methods. Methods are actions that can be applied to objects. The object methods are specified after the object name and separated from it by a dot.

The following example shows the *PRESet* method of *SYSTem* object. This method performs setting of the Analyzer to the preset condition:

```
app.SCPI.SYSTem.PRESet
```

11 Object Properties

Along with methods, objects have properties. Properties are object characteristics that can be set or read out. The object properties are specified after the object name and separated from it by a dot.

To modify an object characteristic, write the value of the corresponding property. To define an object characteristic, read out the value of its property. The following example show the setting of the *POINTS* property of *SWEep* object, i.e. the number of sweep points:

```
app.SCPI.SENSE.SWEp.POINts = 201
```

Note	Some object properties cannot be written, and some object properties cannot be read. In such cases, the properties are indicated as “read only” or “write only”.
------	--

12 Error Handling

You can use different approaches to error handling in VB program:

- check the value of `Err.Number` variable after execution of VB operator, which contains the call to the COM server object;
- use `On Error goto` VB operator.

These approaches are represented in the examples below. The following operator causes an error in VB program as “S13” value of the *DEFine* property is incorrect.

```
app.SCPI.PARAmeter.DEFine = "S13"
```

In the first example, the value of the *Err.Number* variable is checked after execution of the VB operator, which contains the call to the COM server object. *On Error Resume Next* directive instructs VB not to interrupt the program execution when the error is detected but to pass control to the next operator in natural order.

```

Dim app
Public Sub HandleError1()
Set app = CreateObject("S8081.Application")
On Error Resume Next
app.SCPI.PARAmeter.DEFine = "S13"
If Err.Number <> 0 Then
Msg = "Error # " & Str(Err.Number) & " was generated by " &_
Err.Source & Chr(13) & Err.Description
MsgBox Msg, "Error"
End If
...
End Sub

```

In the second example, *On Error GoTo ErrHandler* directive instructs VB to interrupt the program execution when the error is detected and to pass control to *ErrHandler* label.

```

Dim app
Public Sub HandleError2()
Set app = CreateObject("S8081.Applcation")
On Error GoTo ErrHandler
app.SCPI.PARAmeter.DEFine = "S13"
...
Exit Sub
ErrHandler:
Msg = "Error # " & Str(Err.Number) & " was generated by " &_
Err.Source & Chr(13) & Err.Description
MsgBox Msg, "Error"
End Sub

```

13 COM Automation Data Types

In COM automation, there are the following data types, which can be used for client-to-server communication:

Long 32-bit signed integer, value range from -2147483648 to 2147483647

Double	64-bit double-precision floating point, value range from $-1.79769313486232E308$ to $-4.94065645841247E-324$ for negative values, and from $4.94065645841247E-324$ to $1.79769313486232E308$ for positive values
Boolean	16-bit integer, two values 0 – <i>false</i> , 1 – <i>true</i>
String	Variable-length string
Variant	Can be either a value of arbitrary type or an array of values of arbitrary type. In this case, the term “arbitrary type” means any allowed type of COM automation. A variable contains information about its type and array size (if it is an array). It is used for communication of data arrays between a client and a server.

14 Measurement Data Arrays

Measurement data can be either complex values or real values. This depends on the format selected by the user. For example, the data is real in logarithmic magnitude format and the data is complex in polar format.

The measurement data is transferred in a *Variant* type variable, which represents an array of *Double* type. To transfer one complex measurement, two adjacent array cells are used. To transfer one real measurement two adjacent array cells are used as well but the second cell is always equal to 0. Thus, measurement data array size is a double number of the measurement points.

15 COM Server Commands

NAME

<i>Object Type</i>	Property (read only)
<i>Data Type</i>	String
<i>Description</i>	Instrument information string. String format: manufacturer, model, serial number, number of firmware version and number of software version.
<i>Range</i>	up to 40 characters
<i>Syntax</i>	Dim <i>ID</i> As String <i>ID</i> = app.NAME
<i>Equivalent Softkeys</i>	None

READY

<i>Object Type</i>	Property (read only)
<i>Data Type</i>	Boolean
<i>Description</i>	Ready state of the instrument. Reads out the <i>True</i> value after successful completion of the boot process (about 10 sec). The analyzer must be connected to PC by a USB cable.
<i>Syntax</i>	Dim <i>State</i> as Boolean <i>State</i> = app.READY

<i>Equivalent Sofikeys</i>	None
----------------------------	-------------

SCPI.ABORT

<i>Object Type</i>	Method
<i>Description</i>	Aborts the sweep and switches the triggers of all the channels to <i>Hold</i> . The channels in <i>Continuous</i> trigger mode switch to waiting for a trigger. If the trigger source is set to <i>Internal</i> , the channel from waiting for a trigger turns to a new sweep.
<i>Syntax</i>	<code>app.SCPI.ABORT</code>
<i>Equivalent Sofikeys</i>	Stimulus > Trigger > Restart

SCPI.CALCulate(*Ch*).FSIMulator.SENDEd.DEEMbed.PORT(*Pt*). USER.FILename

<i>Object Type</i>	Property (read/write)
<i>Data Type</i>	String
<i>Target</i>	Port <i>Pt</i> of channel <i>Ch</i> , <i>Ch</i> : channel number 1–16 (see Table 1 on page 25) <i>Pt</i> : port number 1–2 (see Table 2 on page 25)
<i>Description</i>	De-embedding function file name (*.s2p). The file contains the circuit S-parameters in Touchstone format.
<i>Range</i>	up to 256 characters
<i>Preset Value</i>	""
<i>Syntax</i>	Dim <i>File</i> As String <i>File</i> = <code>app.SCPI.CALCulate(<i>Ch</i>).FSIMulator.SENDEd.DEEMbed.PORT(<i>Pt</i>).USER.FILename</code> <code>app.SCPI.CALCulate(<i>Ch</i>).FSIMulator.SENDEd.DEEMbed.PORT(<i>Pt</i>).USER.FILename =</code> <code>"network.s2p"</code>

SCPI.IEEE4882.RST

<i>Object Type</i>	Method
<i>Target</i>	Instrument
<i>Description</i>	Restores the default settings of the instrument. There is difference from presetting the instrument with the SCPI.SYSTem.PRESet method – in this case the trigger mode is set to <i>Hold</i> .
<i>Syntax</i>	<i>app</i> .SCPI.IEEE4882.RST
<i>Equivalent Softkeys</i>	None

SCPI.IEEE4882.TRG

<i>Object Type</i>	Method
<i>Target</i>	Instrument
<i>Description</i>	If the trigger source is set to GPIB/LAN (SCPI.TRIGger.SEQuence.SOURce property is set to "BUS"), triggers a sweep. If the trigger source is not set to the bus (SCPI.TRIGger.SEQuence.SOURce property is not set to "BUS") or the instrument is not waiting for a trigger, the method is ignored.
<i>Syntax</i>	<i>app</i> .SCPI.IEEE4882.TRG

SCPI.INITiate(*Ch*).CONTInuous

<i>Object Type</i>	Property (read/write)
<i>Data Type</i>	Boolean
<i>Target</i>	Channel <i>Ch</i> , <i>Ch</i> : channel number 1–16 (see Table 1 on page 25)

<i>Description</i>	The ON/OFF state of the continuous trigger initiation mode. If the continuous trigger initiation mode is set to OFF, the channel turns to the hold state.
<i>Allowable Values</i>	True: Continuous trigger initiation mode ON False: Continuous trigger initiation mode OFF
<i>Preset Value</i>	True
<i>Syntax</i>	Dim <i>Status</i> As Boolean <i>Status</i> = app.SCPI.INITiate(<i>Ch</i>).CONTinuous <i>app.SCPI.INITiate(Ch).CONTinuous</i> = False
<i>Notes</i>	The sweep start in continuous trigger initiation mode depends on the trigger source. If the trigger is set to internal, the sweeps will go immediately one after another. If the trigger is set otherwise, the sweep will start when the trigger signal is received.
<i>Equivalent Softkeys</i>	Stimulus > Trigger > Continuous Stimulus > Trigger > Hold

SCPI.INITiate(*Ch*).IMMEDIATE

<i>Object Type</i>	Method
<i>Target</i>	Channel <i>Ch</i> , <i>Ch</i> : channel number 1–16 (see Table 1 on page 25)
<i>Description</i>	Sets the channel to the single trigger mode. Before this method is called, the channel must be in hold state, otherwise an error occurs (error code 213) and the method is ignored. On completion of the sweep, the channel goes back into the hold state. The method returns control before the end of the sweep.
<i>Syntax</i>	<i>app.SCPI.INITiate(Ch).IMMEDIATE</i>
<i>Notes</i>	The sweep start in the single trigger mode depends on the trigger source. If the trigger is set to internal, the sweep will start immediately after the method is called. If the trigger is set otherwise, the sweep will start when the trigger signal is received.
<i>Equivalent Softkeys</i>	Stimulus > Trigger > Single

SCPI.MMEMory.CATalog(*Dir*)

<i>Object Type</i>	Property (read only)
<i>Data Type</i>	String
<i>Description</i>	<p>This command reads out the following information on the hard drive:</p> <ul style="list-style-type: none"> • Space in use • Available space • Name and size of all files (including directories) in the specified directory <p>Format: ("{A},{B},{Name 1},{Size 1},{Name 2},{Size 2}, ... ,{Name N},{Size N}")</p> <p>Where N is the number of all files in the specified directory and n is an integer between 1 and N. {A}: Space in use of the hard drive (byte). {B}: Available space of the hard drive (byte). {Name n}: Name of the n-th file (directory). {Size n}: Size (byte) of the n-th file (directory). Always 0 for directories.</p>
<i>Parameter</i>	<i>Dir</i> – Directory name whose information you want to read out
<i>Syntax</i>	<p><i>Dim Cat as String</i></p> <p><i>Cat = app.SCPi.MMEMory.CATalog("\.")</i></p>
<i>Equivalent Sofikeys</i>	None

SCPI.MMEMory.COPY(*Src, Dst*)

<i>Object Type</i>	Method
<i>Target</i>	Instrument
<i>Description</i>	Copies a file.
<i>Syntax</i>	<i>app</i> .SCPI.MMEMory.COPY(<i>Src, Dst</i>)
<i>Parameter</i>	<i>Src</i> – Source file name. String data type. <i>Dst</i> – Destination file name. String data type.
<i>Equivalent Softkeys</i>	None

SCPI.MMEMory.DELEte(*File*)

<i>Object Type</i>	Method
<i>Target</i>	Instrument
<i>Description</i>	Deletes a file.
<i>Syntax</i>	<i>app</i> .SCPI.MMEMory.DELEte(<i>File</i>)
<i>Parameter</i>	<i>File</i> – File name. String data type.
<i>Equivalent Softkeys</i>	None

SCPI.MMEMory.LOAD.CHANnel.STATe

<i>Object Type</i>	Property (write only)
--------------------	-----------------------

<i>Data Type</i>	String
<i>Target</i>	Active channel
<i>Description</i>	Recalls the instrument state for the active channel, saved in one of the four memory registers by the SCPI.MMEMory.STORe.CHANnel.STATe property.
<i>Range</i>	"A" : Recall from register A "B" : Recall from register B "C" : Recall from register C "D" : Recall from register D
<i>Out of Range</i>	The value is ignored.
<i>Syntax</i>	<code>app.SCPI.MMEMory.LOAD.CHANnel.STATe = "A"</code>
<i>Equivalent Sofikeys</i>	Save/Recall > Recall Channel > State A B C D

SCPI.MMEMory.LOAD.CKIT(*Ck*)

<i>Object Type</i>	Property (write only)
<i>Data Type</i>	String
<i>Target</i>	Calibration kit <i>Ck</i> , <i>Ck</i> : calibration kit number 1–11 (see Table 6 on page 179)
<i>Description</i>	Recalls the definition file for the calibration kit. The file must be saved by the SCPI.MMEMory.STORe.CKIT(<i>Ck</i>) property.
<i>Range</i>	up to 254 characters
<i>Syntax</i>	<code>app.SCPI.MMEMory.LOAD.CKIT(<i>Ck</i>) = File</code>
<i>Notes</i>	If the full path to the file is not specified, the <code>\CalKit</code> subdirectory of the main directory will be searched for the file. The calibration kit definition file has <code>*.ckd</code> extension by default.
<i>Equivalent Sofikeys</i>	None

Table 6. Ck: Calibration Kit Number

<i>Data Type</i>	Long
<i>Description</i>	Calibration kit number.
<i>Range</i>	from 1 to 11
<i>Out of Range</i>	An error occurs. Error code: 114.
<i>Notes</i>	If the calibration kit number is not specified, it is taken as equal to 1.

SCPI.MMEMory.LOAD.LIMit

<i>Object Type</i>	Property (write only)
<i>Data Type</i>	String
<i>Target</i>	Active trace of the active channel.
<i>Description</i>	Recalls the specified limit table file. The file must be saved by the SCPI.MMEMory.STORe.LIMit property.
<i>Range</i>	up to 254 characters
<i>Syntax</i>	<i>app</i> .SCPI.MMEMory.LOAD.LIMit = <i>File</i>

SCPI.MMEMory.STORe.CKIT(*Ck*)

<i>Object Type</i>	Property (write only)
<i>Data Type</i>	String
<i>Target</i>	Calibration kit <i>Ck</i> , <i>Ck</i> : calibration kit number 1–11 (see Table 6 on page 179)
<i>Description</i>	Saves the definition file for the calibration kit parameters.
<i>Range</i>	up to 254 characters
<i>Syntax</i>	<code>app.SCPi.MMEMory.STORe.CKIT(<i>Ck</i>) = File</code>

<i>Notes</i>	If the full path to the file is not specified, the file will be saved to the <code>\CalKit</code> subdirectory of the main directory. The calibration kit definition file has <code>*.ckd</code> extension by default.
<i>Equivalent Softkeys</i>	None

SCPI.MMEMory.STORe.FDATa

<i>Object Type</i>	Property (write only)
<i>Data Type</i>	String
<i>Target</i>	Active trace of the active channel
<i>Description</i>	Saves the CSV formatted data into a file.
<i>Range</i>	up to 254 characters
<i>Syntax</i>	<code>app.SCPi.MMEMory.STORe.FDATa = File</code>
<i>Notes</i>	If the full path to the file is not specified, the file will be saved to the <code>\CSV</code> subdirectory of the main directory. The files have <code>*.csv</code> extension by default.
<i>Equivalent Softkeys</i>	Save/Recall > Save Trace Data

SCPI.MMEMory.STORe.IMAGe

<i>Object Type</i>	Property (write only)
<i>Data Type</i>	String
<i>Target</i>	Instrument
<i>Description</i>	Saves the display image in BMP or PNG format into a file.
<i>Range</i>	up to 254 characters
<i>Syntax</i>	<code>app.SCPi.MMEMory.STORe.IMAGe = File</code>
<i>Notes</i>	If the full path to the file is not specified, the file will be saved to the <code>\Image</code> subdirectory of the main directory. If the file has <code>*.png</code> extension, the file has PNG format, in all the other cases the file has BMP format.

Example 1. Instrument Information String Readout

The following program reads out and displays on the screen the instrument information string – the Name property of the COM object. The string contains the following fields:

Manufacturer, Model, Serial Number, Software Version/Firmware Version

For example:

CMT, S8081, 09381020, 1.01/01

```
Dim app As Object
Sub Example1()
Set app = CreateObject("S8081.Application")
ID = app.Name
MsgBox ("Information string read out: " + ID)
End Sub
```

Example 2. Checking the Instrument Ready State

Normally, the user control program starts when the analyzer executable module is running, the instrument booting is completed, and the instrument is ready for use. In some cases, it is recommended to check if the instrument is ready for use. The instrument may be not ready for use if it is not connected to PC via USB cable. Moreover, if the analyzer executable module has not been started in advance, the *CreateObject* function will automatically start the application and then within about 10 seconds the instrument booting will be in progress. The instrument will not be ready for use until the booting is completed. The *Ready* property is used to check if the instrument is ready for use.

The following program checks the *Ready* property right after a COM object has been created. If the analyzer executable module has been started in advance and the booting is completed, “*Analyzer is ready*” will be displayed. If the *Ready* property value is *False*, 10 second delay is activated for the case the analyzer executable module has been started by the COM object creation. In 10 seconds the program rechecks the *Ready* property. If the value is *True*, “*Analyzer is ready*” will be displayed, if otherwise, “*Analyzer is not ready*” will be displayed, what means the instrument is not turned on or it is not connected to PC via USB cable.

```
Dim app As Object
Sub Example2()
Set app = CreateObject("S8081.Application")
If app.READy = False Then
    Application.Wait (Now + TimeValue("0:00:10"))
    If app.READy = False Then
        MsgBox ("Analyzer is not ready")
        Exit Sub
    End If
End If
MsgBox ("Analyzer is ready")
End Sub
```

Example 3. Setting the Measurement Parameters

The following program shows the setting of some measurement parameters. First, the instrument is reset to the factory settings. Then the following parameters are set:

- Two channel windows are opened and allocated one above the other.
- The number of traces is set to 2 in the first channel window, the traces are allocated in different graphs in the channel window.
- For the first channel the stimulus parameters are set as follows: the frequency range from 1 MHz to 2 GHz, the number of measurement points 401.
- For the second channel the stimulus parameters are set as follows: the frequency range from 800 MHz to 900 MHz, the number of points 51, IF bandwidth 100 Hz, stimulus power -10 dBm.
- In the first channel window: S11 measurement is set for the trace 1, S22 measurement is set for the trace 2. The Smith chart format is set for the both traces.
- In the second channel window: S21 measurement and logarithmic magnitude format are set for the single trace. Then the auto scale function is called for this trace.

```
Dim app As Object

Public Sub Example3()
    Set app = CreateObject("S8081.Application")

    app.SCPI.SYSTem.PRESet

    app.SCPI.DISPlay.Split = 2
    app.SCPI.Calculate(1).Parameter.Count = 2
    app.SCPI.DISPlay.Window(1).Split = 3

    app.SCPI.SENSE(1).Frequency.Start = 100000
    app.SCPI.SENSE(1).Frequency.STOP = 2000000000
    app.SCPI.SENSE(1).SWEep.Points = 401

    app.SCPI.SENSE(2).Frequency.Start = 800000000
    app.SCPI.SENSE(2).Frequency.STOP = 900000000
    app.SCPI.SENSE(2).SWEep.Points = 51
    app.SCPI.SENSE(2).BANDwidth.RESolution = 100
    app.SCPI.Source(2).Power.LEVel.IMMEDIATE.AMplitude = -10

    app.SCPI.Calculate(1).Parameter(1).DEFine = "S11"
```

```
app.SCPI.Calculate(1).Parameter(2).DEFine = "S22"  
app.SCPI.Calculate(1).Parameter(1).Select  
app.SCPI.Calculate(1).Selected.Format = "SMIT"  
app.SCPI.Calculate(1).Parameter(2).Select  
app.SCPI.Calculate(1).Selected.Format = "SMIT"  
  
app.SCPI.Calculate(2).Parameter(1).DEFine = "S21"  
app.SCPI.Calculate(2).Parameter(1).Select  
app.SCPI.Calculate(2).Selected.Format = "MLOG"  
app.SCPI.DISPlay.Window(2).TRACe(1).Y.SCALe.AUTO  
  
End Sub
```

Example 4. Measurement Data Acquisition

The following program shows data array acquisition with further writing into a file. The program also shows the method of a sweep triggering and waiting for the sweep completion.

Three variables F , M , P are declared in the second string of the code. They are used for arrays of frequency values (Hz), magnitude values (dB), and phase values (degree) respectively.

After the instrument has been reset to the factory settings, two operators are used for the sweep triggering and waiting for the sweep completion:

```
app.SCPI.TRIGger.SEQuence.Source = "bus"  
app.SCPI.TRIGger.SEQuence.Single
```

The first operator sets the GPIB/LAN bus command or the COM/DCOM interface command as a trigger source. It aborts the sweep and switches the instrument to waiting for a trigger. The second operator is used for a new sweep triggering and waiting for the sweep completion.

Note	Unlike the <i>SCPI.TRIGger.SEQuence.IMMEDIATE</i> and <i>SCPI.IEEE4882.TRG</i> commands, which are completed immediately after a trigger generation, the <i>SCPI.TRIGger.SEQuence.Single</i> command is not completed until the end of the sweep. Using the <i>SCPI.TRIGger.SEQuence.Single</i> command is the simplest way to set the waiting for the sweep completion.
------	--

On completion of the sweep, three arrays are read out: frequency values, magnitude values and phase values. Before the magnitude and phase arrays are read out, the corresponding trace format is set.

The array size of frequency F is equal to the number of measurement points, and the array size of magnitude M and phase P is equal to the double number of measurement points (see section 11 “Measurement Data Arrays”). In rectangular formats (for magnitude and phase) the measurement data are real numbers located in even cells of the array. Odd cells of the array contain 0.

On completion of the program, the frequency, magnitude and phase values for each measurement point are written string by string into the file named *TESTFILE*.

Example 6. Program Written in LabView

The following LabView program represents an example of the measurement parameter setting, as well as acquisition and display of the measurement data array. The program also shows a method of the sweep triggering and waiting for the sweep completion.

Below see the block diagram of the program and the front panel of the program with the program execution result.

The front panel contains the entry field for the instrument network name or IP address. This field is used to control the instrument with DCOM technology from a remote PC, on which the LabView package is executed. This example can also be used on a single PC running the instrument program. In this case leave this field empty.

The user must enter the instrument name in the entry field and click the “Run” button. As the result of the program, the instrument information string will be displayed and the measurement trace of transmission coefficient will be plotted.
